GT 4.2.0 C WS Core : System Administrator's Guide
GT 4.2.0 C WS Core : System Administrator’s Guide

Introduction

This guide contains advanced configuration information for system administrators working with C WS Core. It provides references to information on procedures typically performed by system administrators, including installation, configuring, deploying, and testing the installation.

⚠️ Important

This information is in addition to the basic Globus Toolkit prerequisite, overview, installation, security configuration instructions in the Installing GT 4.2.0. Read through this guide before continuing!

Chapter 1. Building and Installing

If you want to install only C WS Core (as opposed to the entire Globus Toolkit), we describe two options below: from the installer and from CVS.

In order to build and install the C WS-Core component from an official release:

Table 1.1. Building C WS Core from installer

<table>
<thead>
<tr>
<th></th>
<th>Obtain the latest GT 4.x.x release tarball installer from the Download webpage(^1).</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Untar the tarball:</td>
</tr>
<tr>
<td></td>
<td><code>tar xvfz gt&lt;version&gt;-all-source-installer.tar.gz</code></td>
</tr>
<tr>
<td>3</td>
<td>Change to the installer directory:</td>
</tr>
<tr>
<td></td>
<td><code>cd gt&lt;version&gt;-all-source-installer</code></td>
</tr>
<tr>
<td>4</td>
<td>Run:</td>
</tr>
<tr>
<td></td>
<td><code>./configure -prefix=&lt;path to install&gt;</code></td>
</tr>
<tr>
<td>5</td>
<td>Run:</td>
</tr>
<tr>
<td></td>
<td><code>make wsc</code></td>
</tr>
<tr>
<td>6</td>
<td>Run:</td>
</tr>
<tr>
<td></td>
<td><code>make install</code></td>
</tr>
</tbody>
</table>

In order to build C WS Core from CVS:

\(^1\) http://www.globus.org/toolkit/downloads/
Table 1.2. Building C WS Core from CVS

1. Obtain the source code for C WS Core from CVS:
   1. To get the latest source from CVS execute:
      ```
cvs -d :pserver:anonymous@cvs.globus.org:/home/globdev/CVS/globus-packages \ check out
   
   packaging
```
   2. Change into the `packaging` directory.
      ```
cd packaging
```

2. Set the `GLOBUS_LOCATION` environment variable to the absolute path of the target directory of your installation.
   On Unix/Linux:
   ```
   setenv GLOBUS_LOCATION /soft/gt4/
   
or
   export GLOBUS_LOCATION=/soft/gt4/
   ```

3. Run `make-packages.pl`
   ```
   ./make-packages.pl -bundles=gt4-c-ws-core -deps -install=$GLOBUS_LOCATION
   ```
Chapter 2. Configuring

N/A (The C WS-Core component does not provide global configuration functionality.)
Chapter 3. Deploying

The C WS-Core does not require configuration/deployment steps. All parameter configuration is done programatically at present.
Chapter 4. Testing

The C WS-Core has a test suite that tests a number of different packages included in the component. The tests can be built using either the wsctests target to make in the installer of a release, or they can be built using the gt4-c-ws-core-test bundle in the ./make-packages.pl command mentioned previously.

The tests are installed into $GLOBUS_LOCATION/test, and can be run from the appropriate sub-directories.
Chapter 5. Security Considerations

1. Security Considerations for C WS Core

1.1. Supported Protocols

C WS-Core supports secure transport (https) and secure message (just X509 signing, not encryption).

1.2. Secure Transport

With secure transport, the entire container must be run over an https transport. This is done by default for the C container. If the user does not want security in the container, or wants to use secure message instead of secure transport, they should use the -nosec argument to globus-wsc-container.

For clients, the secure transport is enabled if the contact URI contains the 'https' scheme instead of 'http', so the client doesn't have to enable or disable it explicitly.
Chapter 6. Debugging

1. Logging

As of 4.2.0, the Globus Toolkit provides system administration logs that are CEDPs best practices\(^1\) compliant.

To enable CEDPS logging, pass the \(-\text{log PATH}\) parameter to the \texttt{globus-wsc-container}\(^2\) program.

For more details on the CEDPS Logging format, including descriptions of reserved name-value pairs, see http://cedps.net/index.php/LoggingBestPractices:

1.1. Sample log file

The \texttt{sample log file}\(^2\) contains many log entries for various scenarios in the C WS container.

\footnote{1 \url{http://cedps.net/index.php/LoggingBestPractices}}
\footnote{2 \url{http://www.globus.org/toolkit/docs/4.2/4.2.0/common/cwscore/sample-container-log.txt}}
Chapter 7. Troubleshooting

For a list of common errors in GT, see Error Codes.

This is a new component. If you are having trouble using it, please let us know!
1. CWS Core Errors
Table 7.1. C WS Core Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Definition</th>
<th>Possible Solutions</th>
</tr>
</thead>
<tbody>
<tr>
<td>globus_soap_message_module: Failed</td>
<td>Unable to contact service container</td>
<td>Check that the service endpoint refers to a running container.</td>
</tr>
<tr>
<td>sending request <a href="http://widgets.com/WidgetPortType/createWidgetRequest">http://widgets.com/WidgetPortType/createWidgetRequest</a>.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>globus_xio: Unable to connect to grid.example.org:8080</td>
<td></td>
<td></td>
</tr>
<tr>
<td>globus_xio: System error in connect: Connection refused</td>
<td></td>
<td></td>
</tr>
<tr>
<td>globus_xio: A system call failed: Connection refused</td>
<td></td>
<td></td>
</tr>
<tr>
<td>globus_soap_message_module: Failed</td>
<td>Service is not running with the expected security credential.</td>
<td>Verify that the service credential being presented by the service (first parenthesized name) is a reasonable certificate name for the service. If so, set the GLOBUS_SOAP_MESSAGE_PEER.IDENTITY.KEY attribute on the soap message handle to that identity. For most command-line wsrf tools, this can be done by passing it as an argument to the -z command-line parameter.</td>
</tr>
<tr>
<td>sending request <a href="http://widgets.com/WidgetPortType/createWidgetRequest">http://widgets.com/WidgetPortType/createWidgetRequest</a>.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>globus_xio_gsi: gss_init_sec_context failed. GSS Major Status: Unexpected</td>

<td>The failure occurred during a handshake read.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>globus_xio: An end of file occurred</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Chapter 8. Usage statistics collection by the Globus Alliance

1. Usage statistics sent by C WS Core

The following usage statistics are sent by C WS Core by default in a UDP packet:

- On container start
  - ip address of container
  - container id - random number
  - event type - container startup
  - list of deployed service names

- On container shut down
  - ip address of container
  - container id - random number
  - event type - container shutdown
  - list of activated services

It sends it at container startup (globus-wsc-container) and receipt of that packet tells us that the container started.

If you wish to disable this feature, you can set the following environment variable before running the C container:

```bash
export GLOBUS_USAGE_OPTOUT=1
```

By default, these usage statistics UDP packets are sent to `usage-stats.globus.org:4180` but can be redirected to another host/port or multiple host/ports with the following environment variable:

```bash
export GLOBUS_USAGE_TARGETS="myhost.mydomain:12345 myhost2.mydomain:54321"
```

You can also dump the usage stats packets to stderr as they are sent (although most of the content is non-ascii). Use the following environment variable for that:

```bash
export GLOBUS_USAGE_DEBUG=MESSAGES
```

Also, please see our policy statement\(^1\) on the collection of usage statistics.
